

Full Market Brief (TEST)

Date (ET): Sun Feb 8, 2026 **Mode:** Weekend wrap + Monday watchlist (stocks-only)

Note: This is a “full report” template to validate the cron workflow and content format. Some market datapoints may require live market-data feeds for exact closes; where I don’t have authoritative numbers I focus on decision-relevant signals and explicitly label assumptions.

1) Executive summary (what matters)

- **Primary driver:** rates sensitivity + leadership/breadth. The most useful question right now isn’t “up or down?”—it’s **which sectors are leading and whether leadership is broadening** beyond a handful of mega-caps.
 - **Base case (conservative):** expect **higher dispersion** (bigger gaps between winners/losers) and **faster regime shifts** on macro prints / Fed communication.
 - **Action bias:** keep the portfolio anchored in **quality + balance-sheet strength**, and treat cyclicals/value “rotation exposure” as **measured tilts**, not all-in bets.
-

2) Market regime checklist (quick diagnostics)

Use this as the weekly “are we in risk-on or risk-off?” scoreboard:

A) Rates / macro

- **10Y yields:** rising quickly → pressure on long-duration growth; falling → supports growth multiples.
- **Real rates & inflation expectations:** if real rates push up, market typically de-rates.
- **Fed posture:** watch for language that changes the implied path (more important than any single datapoint).

B) Breadth / concentration

- **Equal-weight vs cap-weight:** if equal-weight outperforms, it’s a breadth-friendly tape.
- **Advance/decline behavior:** weak breadth + strong index often = fragile.

C) Volatility / risk appetite

- **Volatility pickup:** usually rotates leadership to defensives.
 - **Credit stress:** widening spreads = risk-off signal.
-

3) Current narratives to track (what headlines are really about)

3.1 Rotation narrative

- **Story:** money rotates from expensive, crowded trades toward **value/small-caps/industrials/energy/materials**.
- **Why it can persist:** investors start demanding **earnings breadth** and better “value per dollar” of growth.
- **How it fails:** sudden rate drop + renewed AI/tech momentum; or macro deterioration that punishes cyclicals.

3.2 Earnings narrative (micro dominates)

- **Story:** guidance, margins, and cost of capital decide winners.
- **What to listen for:** demand softness, pricing power, wage pressure, inventory levels, and buyback posture.

3.3 Policy / geopolitics / tariffs (tail risk)

- **Story:** policy shocks can reprice supply chains and energy quickly.
 - **Conservative posture:** don’t bet the book on tail outcomes; instead, build resilience (diversification, liquidity, position sizing).
-

4) Sector playbook (conservative, practical)

Defensives (staples / healthcare)

- **When they work:** volatility up, growth scare, or “risk-off”.
- **What to monitor:** pricing power, reimbursement/regulatory chatter (healthcare), input costs.

Financials

- **When they work:** stable-to-higher rates with benign credit; improving breadth.
- **Key risks:** credit deterioration, deposit competition, regulatory changes.
- **Monitor:** NIM trend, charge-offs, loan growth, management tone.

Industrials

- **When they work:** cyclical optimism, capex cycle, infrastructure-like themes.
- **Key risks:** PMI slowdown, order cancellations, margin compression.
- **Monitor:** backlog quality, lead indicators (PMI, freight), pricing power.

Energy

- **When they work:** crude stability/uptrend, supply discipline.
- **Key risks:** crude drawdown, policy shocks, demand shock.
- **Monitor:** crude curve, inventories, OPEC+ headlines.

Tech / “AI infrastructure”

- **When it works:** rates stable/down, strong earnings visibility.
 - **Key risks:** crowded positioning, valuation, capex cycle disappointment.
 - **Monitor:** guidance on spend, unit economics, customer concentration.
-

5) Watchlist (themes + what to watch)

Because you haven’t shared tickers yet, this is **theme-first**. Once you send 3–10 tickers, I’ll pin this to names.

Watchlist themes (high-signal)

- 1) **Rates sensitivity / duration:** long-duration growth vs value tilt.
- 2) **Broadening leadership:** equal-weight and cyclicals participation.
- 3) **Credit conditions:** early warning if spreads widen.
- 4) **Energy trend:** oil stability and inventory surprises.
- 5) **Earnings dispersion:** guidance surprises drive big gaps.

“Red flags” (stop-and-reassess triggers)

- Sharp, persistent spike in yields.
 - Macro print that forces rapid repricing of Fed path.
 - Credit spreads widening + equity weakness together.
 - Sector leadership flipping to defensives abruptly (sustained).
-

6) What to do next (MVP tracker steps)

To turn this into a portable product quickly:

- 1) **Send me tickers** (even a small set):

- Stocks: 5–15 tickers you care about (holdings + watchlist mixed is fine)
- 2) Tell me your **time horizon**:
 - Trading (days/weeks) vs Investing (months/years)
- 3) Tell me your **risk budget**:
 - Conservative / Balanced / Aggressive

Then I will produce an MVP tracker with: - Holdings (blank if you want) + Watchlist - Per-ticker: thesis (1–2 lines), key risks, catalysts, “what to monitor”, and a simple conviction/position-size guide.

Appendix: Template that will repeat daily (for the cron)

- Headline (1 line)
- Highlights (5–10 bullets)
- Watchlist (3–7)
- What to do next (1–3)
- Link to full report on request
